DESCRIPTION

MT440 are intended for measuring and monitoring single-phase or three-phase electrical power network. They measure RMS value by means of fast sampling of voltage and current signals, which makes instruments suitable for acquisition of transient events. A built-in microcontroller calculates measurands (voltage, current, frequency, energy, power, power factor, THD phase angles, etc.) from the measured signals

APPLICATION

The MT440 multifunction transducer is used for measuring and monitoring of all single-phase or three-phase values. Wide range of various I/O modules makes MT440 a perfect choice for numerous applications. MT440 is delivered un-configured for customer configuration with user friendly setting software MiQen. MT440 supports standard serial communication RS232 or RS485 with speed up to 115200 baud, which is perfect for simple applications and serial bus interfacing.

Additional USB 2.0 interface can only be used for a fast set-up without need for auxiliary power supply. This interface is NOT galvanically isolated from power inputs (aux. supply and measurement inputs) and can be used ONLY unconnected to power inputs.

PROGRAMMING

MT440 multifunction transducer is completely programmable. Primary-secondary ratio (U, I), alarm limits, energy counter, input and output values are all programmed by setting software MIQen via RS232 or RS485 communication.

It is possible to choose between several standard output value ranges (- 100 ... 0 ... 100%):

- 10 ... 0 ... 10 V,
- 1 ... 0 ... 1 V,
- 20 ... 0 ... 20 mA,
- 10 ... 0 ... 10 mA,
- 5 ... 0 ... 5 mA,
- 1 ... 0 ... 1 mA,.

Within these six ranges it is possible to set any linear or bent (with maximum 5 break points) output characteristic.

Examples of settings with linear and bent characteristic

ALARMS

MT440 supports setting up to 16 alarms in two alarm groups. Alarms can be set for any of measured parameters by setting condition and a limit value. A time constant of maximum demand values in a thermal mode, a delay time and switch-off hysteresis are defined for each group of alarms. To each of two alarm groups an alarm output (solid-state or electromechanical relay) can be dedicated.
